

- Consider the two independent Brownian motions, (W_t) and (V_t) . Which of the following processes is Brownian motion:
 - $Z_t = \frac{1}{2}W_t + \frac{1}{2}V_t$
 - $Q_t = \frac{1}{\sqrt{2}}W_t + \frac{1}{\sqrt{2}}V_t$
- Let $Y_t = \int_0^t (W_u + u)^2 dW_u$. Find $E(Y_t)$ and $\text{Var}(Y_t)$.
- James Bond plays in a casino. At every bet he wins one pound with probability 0.5, loses one pound with probability 0.4 or wins nothing with probability 0.1. His initial fortune is $X_0 = 10$ pounds. He stops playing if he goes bankrupt or if he achieves the fortune of 300 pounds (airline ticket price from London to Moscow).
 - Find the constant a such that $M_t = a^{X_t}$ is a martingale.
 - What is the probability that James Bond will win enough to buy the ticket?
- Let R_t be the exchange rate at time t . We suppose that $dR_t = \mu R_t dt + \sigma R_t dW_t$. Consider the inverse exchange rate $I_t = 1/R_t$. Find the expression for dI_t . The expression should not contain R_t .
- It is known that M_t is a martingale. We also know that in short-hand notation $(dM_t)^2 = dt$. What can we say about the process $Y_t = M_t^2 - t + 2017$?
- Solve the stochastic differential equation

$$dX_t = \frac{-1}{1-t} X_t dt + dW_t, \quad X_0 = 0 \quad (1)$$

You may use or not use the following hints:

- The correct answer will contain the integral $\int_0^t \frac{1}{1-u} dW_u$ that cannot be simplified.
- Solve the ordinary differential equation

$$dY_t = \frac{-1}{1-t} Y_t dt, \quad Y_0 = 1 \quad (2)$$

- Represent X_t as $X_t = Y_t \cdot Z_t$ and find the equation for dZ_t . Find the expression for Z_t .

- Consider the framework of the Black and Scholes model. Let P be the original probability measure and \tilde{P} be the risk-neutral probability measure. Provide an example of three events A , B and C such that $P(A) > \tilde{P}(A)$, $P(B) < \tilde{P}(B)$, $P(C) = \tilde{P}(C)$.
- Consider the framework of the Black and Scholes model. The asset pays you 1 dollar at fixed time T if and only if the price of a share S_T is above the strike-price K . Find the current price X_0 of this asset.

You may decide not to solve any number of problems from this homework and send me a solution of corresponding number of problems from the old exams collection instead (see <http://bdemeshev.github.io/sc401/>). In this case you should use L^AT_EX or markdown formats. Please, be polite and avoid sending solutions of already solved problems or problems taken by someone else. You should fill in your choice at <http://goo.gl/8TFhWE>.

The due date for this homework — 10.01.2017 before exam. If you decide to solve problems from an old exam you should send the solution of these problems by e-mail to boris.demeshev@gmail.com before 09.01.2017 consultation hour. I will check your solutions and add them into the exams collection so they are available for everyone.
